"Spectrophotometric Determination of 6-Azauracil in Presence of 6-Azauracil Riboside."

Prague, Ceskoslovenska Farmacie, Vol 12, No 8, 1963, pp 385-388

Abstract: The spectroscopic determination is based on the reaction of 6-azauracil with sodium nitroprusside that produces a colored compound. It is yellow in an alkaline medium and becomes red upon acidification. Light absorption is measured at 500 m μ . 6-azauracil riboside does not react; 6-azauracil can be determined in concentrations as low as 1 in 100,000. The analytical method described was used to study microbial ribosidation of 6-azauracil. The results obtained agreed with measurements made by chromatography in a column filled with Hyflo-Supercel with an acetate buffer at pH 4.6; n-butanol eluates were evaluated spectrophotometrically at 265 m μ .

"Microbial Transformations of Steroids. Preparation of Prednisone from Cortisone Acetate by a Microbial Process."

Prague, Ceskoslovenska Farmacie, Vol 12, No 8, 1963, pp 408-409

Abstract: Using a strain of *Flavobacterium peregrinum* saponification of cortisone acetate was carried out; it was followed by fermentation yielding free cortisone; this was dehydrogenated in the solution used for the first step by *Mycobacterium flavum* which produced prednisone. 70% of theoretical yield was obtained.

PHASE I BOOK EXPLOITATION

CZECH/3583

Dominik Čapek, Major-General, Professor, Doctor of Medical Sciences, and Head of the Department of Aviation Medicine, Charles University, Prague

Fysiologie letce (Physiology of the Airman) [2nd ed.] Prague, Naše vojsko, 1953. 378 p. (Series: Vojenskozdravotnická knihovna, sv. 2) Errata slip inserted. 4,400 copies printed.

Ed.: František Černý, Major-General, Doctor of Medical Sciences; Tech. Ed.: František Pastyřík.

PURPOSE: The book is intended for aviation medicine specialists and air force officers.

COVERAGE: The book covers the field of aviation medicine with a particular emphasis on the physiology and psychopathology of aviation personnel. Physiological effects of acceleration, altitude, and to some extent of climatic factors (cold, glare) as well as of flying hazards (vibration, noise, gas poisoning) are treated in considerable detail. An analysis of airsickness and fatigue, miscellaneous diseases associated with flying, and the role of the sense organâ in spacial orientation is also made. Individual chapters discuss problems ancillary to aviation, such as parachute

111. Development of control of water metabolism. I. Extraction of urine in young rats. II. Development of micturition in puppies. K. Cipek and J. Holick *Physiol. Bohem.*, 1958, 5, 91-98, 97-102

I. In newborn rats micturition did not take place, the urine being retained in the bladder. Micturition was initiated by reflex stimulation of intercostal nerves. About the 18th day emptying before that was induced by stimulation of skin exteroceptors in the penile area which is normally performed by the mother. Reflex emptying of the bladder by experimental perineal stimulation increased urine formation by the kidneys and enabled administered water to be excreted.

II. In puppies stimulation of the perineum caused contraction of the abdominal muscles, alteration in breathing, and a contraction of the bladder. Direct relaxation of the urethral sphincter was not induced. With the development of the adult mechanism of micturition, the area from which mechanical stimulation evoked micturition extended towards the urethral orifice, but there was a weakening in the reflex response to stimulation. "Permeability of Cortical Nephrons to Urea in Rat Kidney."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 3, May 66, pp 186-189

Abstract: Experiments on adult rats were made to study the changes in urea in the proximal and distal tubules of kidneys. The movements of urea correspond to Fick's law of diffusion. The plasmatic flow is much greater than the permeability. Permeability of the distal tubulus for urea is lower than the permeability of the proximal tubulus. The antidiuretic hormone does not influence the permeability of the distal tubulus for urea. The urea efflux in the cortical sectors of the nephron is passive and follows Fick's diffusion law. 4 Figures, 4 Western references. TITLE: A single-phase bridge for current and voltage control with identically biased semiconductor rectifiers. CZ Pat. No. PV 526-65, Class 21

SOURCE: Vynalezky, no. 2, 1966, 10

TOPIC TAGS: electric equipment, transformer, semiconductor rectifier, voltage control, current control

ABSTRACT: A single-phase bridge with continuous voltage and current control, using identically biased semiconductor rectifiers, has been introduced. It consists of four branches, two of them split in two pairs of lines connected, via rectifiers, to the corresponding taps of a regulating transformer. The first lines of each pair are coupled to a group of controlled semiconductor rectifiers; the second lines each with a separate group of uncontrolled semiconductor rectifiers. The groups of uncontrolled rectifiers are interconnected by a switch. In operation, the

Card 1/2

22
B

L 05397-67

ACC NR: AP6020170

controlled rectifiers are linked to the higher voltage tap of the transformer, and the groups of uncontrolled rectifiers to the lower voltage tap. At a change-over, all groups are switched, first to the tap with voltage nearest to that to which the connection is being shifted and then, the group of rectifiers which previously had been coupled with the above-mentioned tap is switched to the succeeding tap. At the same time, a switch actuates connection between the uncontrolled rectifiers lines and also connected from one of these lines to the higher tap of secondary winding of the transformer; a reverse switch actuates connection of the group of controlled rectifiers lines to the same tap of the transformer, whereby the polarity of the latter rectifiers always becomes identical to that of the uncontrolled semiconductor rectifiers in the pertinent main branch of the bridge. TITLE: [A single-phase bridge] CZ Pat. No. 1049-65, Class 21d

SOURCE: Vynalezky, no. 4, 1966, 12

TOPIC TAGS: silicon controlled rectifier, semiconductor rectifier, rectification, electric transformer

ABSTRACT: This patent introduces a single-phase bridge with semiconductor diodes and continuous current and voltage control. Two of the main arms are split into pairs which are used for connecting them to the secondary windings of the control transformer through groups of conventional and controlled semiconductor rectifiers. A group of conventional semiconductor rectifiers is always connected in one branch of each pair. The switch for the secondaries of the control transformer has a pair of contacts for each winding arranged so that the branches with conventional rectifiers are always connected to one contact in the appropriate pair, while the branches with controlled rectifiers are connected to the other. There is only one common set of controlled semiconductor rectifiers connected in one of the remaining branches of the split

Card 1/2

L 40819-66

ACC NR: AP6013155

0

pairs. This branch is connected between the set of controlled rectifiers and the transformer secondaries. A switch connects this branch both to the single remaining branch and to a secondary winding of the transformer. The branch containing the set of controlled rectifiers is shunted by an additional branch between the main arm and the secondary windings of the transformer. This additional branch is also equipped with a breaker contact. [Translation]

"Microbial Transformation of Steroids. XXVI. An Improved Method of Preparation of Cortisone from Cortexolone."

Prague, Ceskoslovenska Farmacie, Vol 15, No 4, May 66, pp 198-199

Abstract [Authors' English summary modified]: *Beauveria bassiana* strain No 663 gives a yield of over 90% in the transformation of cortexolone to epicortisol. The raw epicortisol is acetylated and oxidized selectively to cortisone acetate, without isolating the intermediate products. The acetate is saponified with sodium methylate; free cortisone is obtained with a yield of 78% calculated on the basis of the original cortexolone. With recrystallized cortexolone the yield increases to 80%. 3 Czech references. (Manuscript received 3 Aug 65).

"The EEG Analysis of the Antinicotinic Effect of 6-Azauridine."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 5, Sep 66, p 415

Abstract: An intravenous administration of 6-azauridine (AZ) does not change the spontaneous electrocorticogram in a dose of 1 g/kg. The persistence of cortical desynchronization induced by nicotine (20 micrograms/kg) was reduced to 48% of the original time. An administration of AZ in the brain cortex causes a cortical desynchronization lasting several minutes, followed by 15-20 minutes of cortical synchronization. 150 minutes after the administration of AZ its effect on cortical desynchronization induced by nicotine disappears completely. The hematoencephalic barrier is the limiting factor in the central effect of AZ. 2 Western, 3 Czech references. Submitted at 14 Days of Physiology at Smolenice, 17 Feb 66.

608. Increasing the efficiency of ball mill work. — Z. Čapek (Stavro, 20, 286, 1950). The development of ball mill work embraces the results of 133 full-scale plant expts. and a series of laboratory expts. over the last 4 years. The measurements of the mill are: Exterior dia. = 13,000 mm., exterior dia. = 2,200 mm.; Chamber I: $f = 3,040$ mm., $d = 2,000$ mm.; Chamber II: $f = 2,440$ mm., $d = 2,040$ mm.; Chamber III: $f = 6,860$ mm., $d = 2,000$ mm. It is sometimes believed that the output of a mill can be increased by introducing finely pre-crushed material into it, but this is untrue. A series of expts. was performed to find the degree of filling required to obtain a certain grain size after the min. time. The results were used on large-scale expts., the filling of each chamber being varied to a limited extent. The decrease of the residue on 70-mesh in each chamber was plotted in Mittag diagrams. The correct course of the curve is the smoothest. Comparing outputs shows that the correct curve does not imply max. output. The effects of changing the filling by 1% only at equal total load are very great. In one series of expts. Chambers I and II were combined and filled with pre-crushed fine material, in another series Chamber III was lined to increase the surface. The output of the mill was compared with the max. output of the mill in its original form. In both series of expts. the output was low. A diagram of the particle size curves, with Graf's curve for comparison, is given and the sizes giving max. output are shown. The belief that fresh clinker is more difficult to grind than aged clinker is shown to be wrong and diagrams are given. The importance of the correct velocity is noted. Addition of electrolytes to the clinker and the use of non-magnetic balls was tried out successfully, increasing the output considerably; theoretical reasons are given. It is thought that the passage of ionized air through the mill might give results similar to the addition of electrolytes. (7 figs., 3 tables.)

Abstract : The problems of a correct control of the quality
of half-finished leather products are discussed,
namely: performance of the required tests under
identical conditions of temperature, moisture,
speed, size of the samples and standardization
of apparatuses; the correct choice of specific
indicators of the quality of the respective half-
finished products; improvement of the test me-
thods. The methods of determination of the qua-
lity of leather for gloves were examined in de-
tail.-- G. Markus

Leather Goods
ORIG. PUB. : Standardizarea, 10, No 10, 491-492 (1958)
ABSTRACT : Experiments on the correlation of the behavior of
leather goods in service with their physico-mechani-
cal properties point to the need for the establish-
ment of more discriminating methods for the deter-
mination of the quality of leather goods. In
addition to the properties specified in the stand-
ard, the authors propose the evaluation of the
following characteristics. For sole leather, wear
resistance, waterproofness under dynamic conditions
and resistance to repeated flexing; good results
